Many options are available. Complete details will need to be finalized to determine requirements and final system costs. Work with your Pro Pac representative to build this machine to your specifications.

Place a Threaded Cap onto a Rigid Container and Torque It

The Inline Filling Systems automatic chuck capper is designed to vertically place a threaded cap onto a rigid container and torque the cap to a specified application torque. This machine is used for caps that can be stripped off a cap chute by the mouth of the container. This starwheel version of the chuck capper is also used where containers are small or irregularly shaped or have wide mouths with flexible side walls.

Generally, containers that run on this type of chuck capper are too unstable to be positively controlled by other capping methods or the mouth of the container has a tendency to become oval when the body is gripped. Like other inline chuck cappers, this version also solves the particulation problem of polymer tightening surfaces with other capping methods.

Features

- Tubular 304 stainless steel welded frame
- Aluminum and 304 stainless steel construction
- Clean, non-painted, non-marring parts
- Easy changeover modular change parts
- Non-scuff chucks for gentle, positive grip
- No tools quick changeover collets
- Torque adjustment without tools
- Clear acrylic guard with 304 stainless steel lower frame
- Safety interlocks on all guard doors

Adjustment discharge height 38" +/-2
Backlog photo optic with automatic stop/restart
